

1 ABSTRACT OF THE DISCLOSURE

A recording apparatus for recording input
information via a memory and a head onto a disc rotated
by disc driving means, comprising a mode switch which
5 allows a first mode instruction of waiting for the
recording and a second mode instruction of performing the
recording to be successively issued, and a control
circuit for controlling the apparatus in such a manner as
10 to place only said memory in a wait state in accordance
with said first mode instruction, and then store said
input information into said memory in accordance with
said second mode instruction, at the same time or
afterwards, starting said disc driving means.
